# **Stat 215A - Week 10**

Zoe Vernon Thanks to Rebecca Barter for sharing her slides

# **Upcoming schedule for the class**

Today (10/26):

- ☐ Group project (lab 4) assigned. Due **Friday 11/9**.
- Evaluating classification algorithms.

Next Friday (10/2):

Causal inference

Friday (11/9): Lab 4 due

Tuesday (11/13): midterm

Friday (11/16): Final project assigned. Due **12/7** (3 weeks).

# **Evaluating classification algorithms**

# **Evaluating classification algorithms**

There are many ways to evaluate the accuracy of classification

- ☐ Test/validation sets
- Cross-validation

- Confusion matrix
- TP, FP, TN, FN
- ROC curve
- Confidence interval for error

### **Train-validation-test sets**

### **Train-validation-test sets**

Split your data into 3 parts

- 1. Training set
- 2. Validation set
- 3. Test set

The size of splits depends on the algorithm you are training.

### **Train-validation-test sets**

#### Split your data into 3 parts

- 1. Training set: train the model on this data
  - a. e.g. run K-nearest neighbors on your data
- 2. Validation set: data used for tuning hyperparameters (don't "learn" from this data
  - a. e.g. tune choice of K (by evaluating models trained with different K's on the validation set)
- 3. Test set: only used once as a test of your final model

### **Cross validation**

Cross validation is a way to doing validation while only splitting your data into train and test sets.

Do K-fold cross validation on the training data to evaluate the models and tune hyperparameters.

After selecting a model, use the test set to check how your model performs.

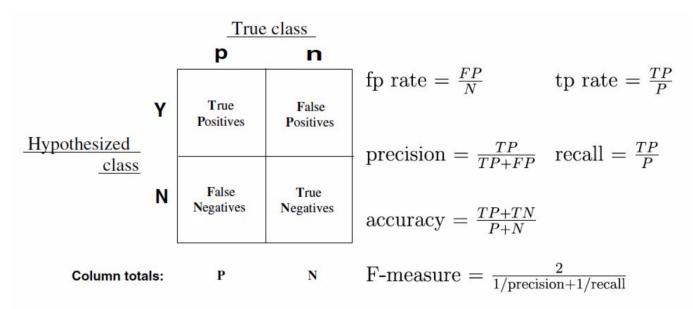

Fig. 1. Confusion matrix and common performance metrics calculated from it.

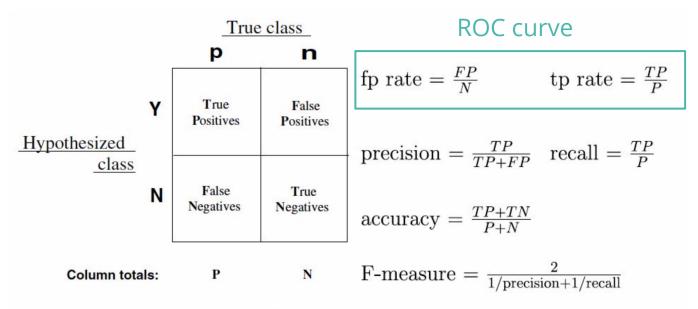

Fig. 1. Confusion matrix and common performance metrics calculated from it.

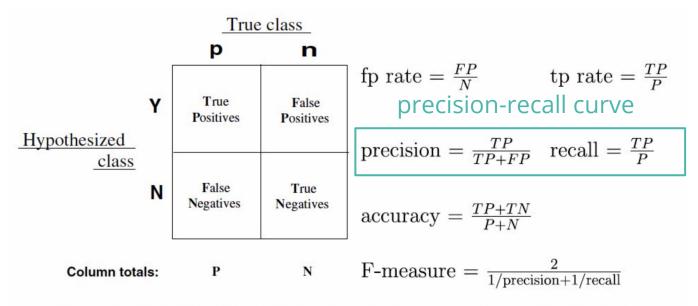

Fig. 1. Confusion matrix and common performance metrics calculated from it.

Used to depict the tradeoff between "hit rates" and false alarm rates" of

classifiers

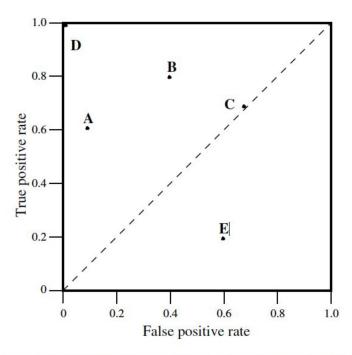

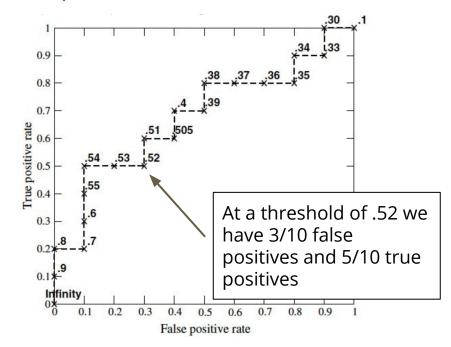

Fig. 2. A basic ROC graph showing five discrete classifiers.

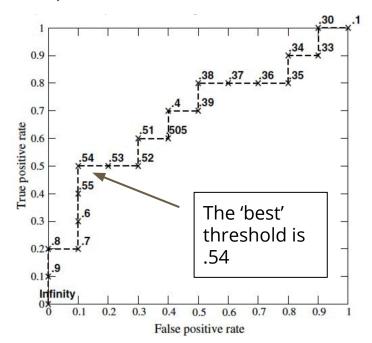

We can generate an ROC curve when the output of a classifier is a probability and we must choose a threshold for the final predicted class

Inst#	Class	Score	Inst#	Class	Score
1	p	.9	11	p	.4
2	p	.8	12	n	.39
3	n	.7	13	p	.38
4	p	.6	14	n	.37
5	p	.55	15	n	.36
6	p	.54	16	n	.35
7	n	.53	17	p	.34
8	n	.52	18	n	.33
9	p	.51	19	p	.30
10	n	.505	20	n	.1

#### **Question:**

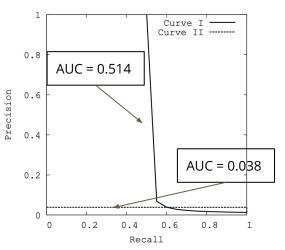

Would this method give an accurate reflection when there is class imbalance?

(e.g. 10% of the observations are in group 1 and 90% are in group 2)

**Question:** Would this method give an accurate reflection when there is class imbalance?

(a) Comparing AUC-ROC for two algorithms

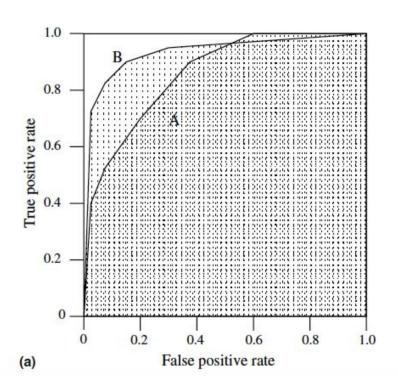

(b) Comparing AUC-PR for two algorithms

Figure 7. Difference in optimizing area under the curve in each space

Source: Davis and Goadrich (2006)

The area under the curve (AUC) is a method for comparing algorithms

The area under the curve (AUC) is a method for comparing algorithms and evaluating classifiers.

The AUC has an important statistical property:

The AUC of a classifier is equivalent to the probability that the classifier will rank a randomly chosen positive instance higher than a randomly chosen negative instance

Care should be taken when using ROC curves to compare classifiers

☐ The ROC graph is often used to select the best classifiers simply by graphing them in ROC space and seeing which one dominates.

Care should be taken when using ROC curves to compare classifiers

- ☐ The ROC graph is often used to select the best classifiers simply by graphing them in ROC space and seeing which one dominates.
- ☐ This is misleading: it is analogous to taking the maximum of a set of accuracy figures from a single test set.

Care should be taken when using ROC curves to compare classifiers

- ☐ The ROC graph is often used to select the best classifiers simply by graphing them in ROC space and seeing which one dominates.
- ☐ This is misleading: it is analogous to taking the maximum of a set of accuracy figures from a single test set.
- ☐ Without a measure of **variance** we cannot compare classifiers

Care should be taken when using ROC curves to compare classifiers

- ☐ The ROC graph is often used to select the best classifiers simply by graphing them in ROC space and seeing which one dominates.
- ☐ This is misleading: it is analogous to taking the maximum of a set of accuracy figures from a single test set.
- ☐ Without a measure of **variance** we cannot compare classifiers

It is a good idea to the average of multiple ROC curves (e.g. via cross validation)

See Fawcett (2005) for examples on how to average

Example: classify.R

### Lab 4: cloud detection

# Groups: see lab4\_groups.csv

Name	Group	Name	Group	Name	Group
Linqing Wei	1	Aummul Baneen	5	Xiao Yun Chang	9
Sonali Dayal	1	Yuchen Zhang	5	Armin Askari	10
Michael Lim	1	Rui Chen	6	Ang Li	10
